

Transform
your fitting
room into a
virtual sound
space

SoundStudio

Real-world experience made possible

Do you want to show your clients how their hearing aids can perform in realistic situations - without leaving your clinic?

The SoundStudio positional audio software simulates realistic environmental sounds to create a life-like virtual space. This enables a flexible and convincing way of counseling and validating hearing aid performance and features.

How does it work?

With SoundStudio, you can simulate a vast number of listening situations in your fitting room. By positioning your client in a multi-speaker, free-field setup, you are in a better position to explain hearing aid features such as directional microphones and noise suppression, making it more understandable for your client.

Ensure satisfied customers

SoundStudio helps you to make sure your client enjoys all listening situations of life and gives them trust in their hearing aids and the hearing aid fitting process. By offering the unique and engaging service of SoundStudio, it can also help you retain and attract more satisfied customers.

Easy access

You can access SoundStudio from the audiometry software for Affinity Compact, Callisto™, and Equinox Evo.

More precise

Common practice today is to take clients outside to test how the hearing aid is performing. With the SoundStudio's calibrated sound stimuli, you can simulate any thinkable listening situation with higher precision.

Personalized hearing care

SoundStudio is a flexible and convincing tool for counseling your clients. You can choose from a large number of virtual sound scenes to match your clients' hearing needs and preferences.
